

Oomero Custom Development

When your process is not standard, the platform can still fit it.

Some firms need more than configuration. Oomero's own development team builds integrations with your CRM and back-office systems, onboarding fields for your industry, and reports in the format your MLRO or regulator expects.

Everything built for you runs on the same platform, API and audit trail as the standard checks, so custom work does not become a separate system to maintain.

What it does

- ✓ Integrations with your CRM and core systems
- ✓ Status changes pushed back to you by webhook
- ✓ Custom reports and exports
- ✓ Customers registered from your CRM through the API
- ✓ Onboarding fields and journeys for your industry
- ✓ Built and supported by the Oomero team

What you get

- ✓ The platform fits your process, not the reverse
- ✓ One audit trail, standard or custom
- ✓ No separate system to maintain
- ✓ A team that already knows the platform

• The Oomero advantage

Why this holds up under scrutiny

01 Built on the platform, not beside it

Custom work uses the same data model, API and audit trail, so a bespoke step is evidenced like any other check.

02 Connects to what you already run

Customers can be registered from your CRM through the API and status changes pushed back by webhook, so nobody re-keys a file.

03 Fields for your industry

Onboarding fields can be set per industry across more than a thousand industries, and new ones added where yours is missing.

04

The people who built it

Development is done by Oomero's own team, who know the platform and the compliance behind it.
